Critical Guidance Protocol for PP Rigid Containers

Document number – PP-CG-01

Introduction – Scope, significance and use

This is a comprehensive laboratory scale evaluation, or protocol, that can be used to assess the compatibility of PP Rigid container packaging innovations with reclamation systems sourcing post-consumer material. For definitions, reference “Plastics Recycling Testing Terminology” at https://plasticsrecycling.org/apr-design-guide/resources/testing-terminology

PP rigid containers typically consist of natural and color homopolymer, copolymer, or random copolymer. Containers are typically in forms of tubs, lids, bottles, and other molded/shaped/formed articles. This test can be used to evaluate the impact of PP rigid container packaging components. Examples including multi-layer constructions, coatings, additives, printing, labels, adhesives, new PP resin controls, new innovative PP resins, multi-material compositions, lids, dispensers and closures.

In APR Processing Practices and Test Protocols, the term “article” is used to mean the package submitted for testing (except in the special case where a resin pellet is tested and is referred to simply as “resin pellet”). The article incorporates the “innovation” or “design feature” which requires test data for an APR recyclability classification. Generally, an “innovation” is a modification or addition to a package construction that provides functional improvements and a “design feature” is an element of design geared toward ease of consumer use or marketing benefit. However, in APR documents the two terms may be used interchangeably.

Data developed by an independent third-party laboratory following this protocol can be used in petitions for APR’s Critical Guidance Recognition. Petitions require data for a control material, and for the innovation articles blended with extruded articles.

The test is not appropriate for package constructions that will not pass through APR’s Sorting Potential Protocols addressing NIR sortation, size, and metallic components. These benchmark tests, labeled SORT-B-01 through B-03, are found at https://plasticsrecycling.org/apr-design-guide/test-methods

The test is also not appropriate for packages that are not in alignment with the APR Design® Guide for Plastics Recycling text. This test is not appropriate for materials that employ time dependent behavior where appearance or physical properties are expected to change over time. If it is questionable whether the test article meets these criteria, the appropriate APR sorting potential protocol or degradability test should be conducted prior to conducting Critical Guidance Evaluation.
Disclaimer: This document has been prepared by the Association of Plastic Recyclers as a service to the plastic industry to promote the most efficient use of the nation's plastic recycling infrastructure and to enhance the quality and quantity of recycled postconsumer plastic. The information in this document is offered without warranty of any kind, either expressed or implied, including WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, which are expressly disclaimed. APR and its members accept no responsibility for any harm or damages arising from the use of or reliance upon this information by any party. Participation in the Recognition Program is purely voluntary and does not guarantee compliance with any U.S. law or regulation or that a package or plastic article incorporating the innovation is recyclable or will be recycled.

Method Summary

This Critical Guidance protocol provides two pathways for testing PP resins and articles with flow diagrams found on pages 8 and 9 for articles that employ multi-layer constructions, coatings, additives, printing, labels, adhesives, new HDPE resin controls, new innovative HDPE resins, multi-material compositions, lids, dispensers and closures. Controls are comprised of similar articles made solely with a control PP resin without the innovation. Reference document APR Polyolefin Standard Laboratory Processing Practices, O-P-00 through O-P-07 for complete details.

Path 1 – Path 1 is utilized for complete PP packages in the form of bottles, jars and jugs that include the innovation being tested. A flow diagram for Path 1, on page 8 illustrates that these articles are separately processed through these steps:

- Granulation
- Commercial Basic Wash and drying
  - Small 100g caustic wash required when labels with adhesives or printing are present
- Elutriation
- Blends created from the processed materials. APR Critical Guidance protocols require blends of 50% control and 50% innovation to be compared with 100% control material. Optional blends can be used if desired by the investigator at 75% control and 25% innovation blend.
- Blends dried, extruded and pelletized
- Pellets subjected to testing and evaluation
- Pelletized material is injection molded into ASTM test parts for mechanical properties evaluation

Path 2 - Path 2 is utilized for testing resins and resin blends that incorporate the innovation being tested but have not been converted into package form. A flow diagram for Path 2 on page 9 illustrates that these articles are separately processed through these steps:

- Control and test dry blends processed for a melt history to represent the initial production heat history.
- Blends created from the processed materials. APR Critical Guidance protocols require blends of 50% control and 50% innovation to be compared with 100% control material. Optional blends can be used if desired by the investigator at 75% control and 25% innovation blend.
- Blends dried, extruded and pelletized
- Pellets subjected to testing and evaluation
- Pelletized material is injection molded into ASTM test parts for mechanical properties evaluation

APR Screening Test Methods:
Polyolefin Packaging Article Sink or Float Evaluation, O-S-01

ASTM Pellet Test Methods:
ASTM D3418 Transition Temperatures and Enthalpies of Fusion and Crystallization of Polymers by Differential Scanning Calorimetry
ASTM D1238 Melt Flow Rates of Thermoplastics by Extrusion Plastometer
ASTM D792 Density and Specific Gravity (Relative Density) of Plastics by Displacement
ASTM D1505 Density of Plastics by the Density-Gradient Technique
ASTM D5630 Ash Content in Plastics
ASTM D6980 Determination of Moisture in Plastics by Loss in Weight
ASTM D1895 Apparent Density, Bulk Factor, and Pourability of Plastic Materials
ASTM D6290 Color Determination of Plastic Pellets

ASTM Part Test Methods:
ASTM D638 Tensile Properties of Plastics
ASTM D256 Determining the Izod Pendulum Impact Resistance of Plastics
ASTM D790 Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials

Optional ASTM Test Methods:
ASTM D1693 Environmental Stress-Cracking of Ethylene Plastics
Method Steps for Extrusion Blends and Injection Molding Evaluation

**Safety Statement:** APR Test and Practice documents do NOT CLAIM TO ADDRESS ALL OF THE SAFETY ISSUES, IF ANY, ASSOCIATED WITH THEIR USE. These Tests and Practices may require the use of electrically powered equipment, heated equipment and molten polymers, rotating motors and drive assemblies, hydraulic powered equipment, high pressure air, and laboratory chemicals. IT IS THE RESPONSIBILITY OF THE USER TO ESTABLISH AND FOLLOW APPROPRIATE SAFETY AND HEALTH PROCEDURES WHEN UNDERTAKING THESE TESTS AND PRACTICES THAT COMPLY WITH APPLICABLE FEDERAL, STATE AND LOCAL REGULATORY REQUIREMENTS. APR and its members accept no responsibility for any harm or damages arising from the use of or reliance of these Tests and Practice documents by any party.

Path 1 Method Steps

The following steps are taken to prepare samples for evaluation; these steps are illustrated in the flow diagram labeled Path 1, and details of each step are presented in the APR Polyolefin Standard Laboratory Processing Practices, O-P-01 through O-P-07 (included in document O-P-00). The amount of material will depend upon the equipment and scale used in each laboratory.

1. Obtain control and test article to use in the evaluation for Path 1. For a list of acceptable control resins, refer to Practice O-P-01.

2. For each of the test and control articles for Path 1, separately:
   a. Granulate articles
   b. Sink-float the control and test materials per the Screening Test O-S-01
   c. Commercial Basic Wash and drying
      i. Small caustic wash required when labels or printing is present
   d. Elutriation of granulated material

3. Prepare the following required blends:
   a. 100% processed control - Sample A
   b. 50/50 processed control and innovation – Sample B
   c. Any optional blends chosen by the investigator, for example: 75/25 processed control and innovation – Sample C

4. Extrude blends and melt filter to create the samples: A pellets, B pellets and optional C pellets.
   a. Extruded pellets to be evaluated for DSC, melt flow, density, ash content, moisture content, bulk density, FTIR, and color.

5. Injection mold part for mechanical evaluation of each blend
   Injection molded part to be evaluated for flexural modulus, tensile strength, notched Izod and optional ESCR.
Path 2 Method Steps

If the form submitted for testing is resin instead of containers, Path 1 method steps 1 and 2 are unnecessary. Steps 3, 4, and 5 for resin samples are illustrated in the flow diagram labeled Path 2. Details of each step are presented in the APR Polyolefin Standard Laboratory Processing Practices, O-P-01 through O-P-07 (included in document O-P-00). The amount of material will depend upon the equipment and scale used in each laboratory.
## Measurements, Report and Guidance Values

### Path 1 - Incoming Flake Analysis

Path 1: Flow Diagram for “PP Rigid” that employ qualified (New resins, additives, coatings, layers, adhesives, labels or blends)

Start

- Obtain PP Control Container
- Obtain PP Innovation Container

Granulation O-P-03

Granulation O-P-03

Commercial Basic Wash O-P-04

Commercial Basic Wash O-P-04

Air Separation O-P-05

Air Separation O-P-05

Create Blends

- Required A: 100% Control Sample
- Optional C: 75% Control Sample, 25% Innovation Sample
- Required B: 50% Control Sample, 50% Innovation Sample

Extrude and Pelletize each Blend O-P-06

Injection Molding ASTM of each Blend O-P-07

End

Required Evaluations:
- Melt Flow Rate
- Density
- Ash
- Moisture
- %PP (FTIR)
- Pellet discoloration
- Screen pack pressure build
- Pellet Appearance
- Pellet Production Performance

Required ONLY for Evaluation of Labels or Printing:
- Caustic Wash Evaluation

Optional:
- ESCR
Path 2: Flow Diagram for “PP Rigid” Resin
(Only an Option When Innovation is submitted as a blended pellet for Pre-Application)

Start

Obtain PP Resin Control
Obtain PP Resin with Innovation

Extrude O-P-06
Extrude O-P-06

Create Blends

Required A
100% Control Sample
Optional C
75% Control Sample
25% Innovation Sample
Required B
50% Control Sample
50% Innovation Sample

Extrude and Pelletize each Blend O-P-06

Injection Molding ASTM of each Blend O-P-05

End

Optional Evaluations:
Screen pack pressure build

Required Evaluations:
Notched Izod Impact
Flexural Modulus
Tensile Strength
Elongation at Yield

Optional:
ESCR

Optional Evaluations:
Melt Flow Rate
Density
Ash
Moisture
%PP (FTIR)
Pellet discoloration
Screen pack pressure build
Pellet Appearance
Pellet Production
Performance
